LLD: Concurrency Control

"Concept & Coding" YT Video Notes

Scenario: Many concurrent request tries to book same Movie theatre Seat

1. Using "SYNCHRONIZED" for the Critical Section:

```
synchronized ()
```

```
{
```

```
  Read Seat Row with ID: 10
```

```
  If Free:
```

```
    Logic to Change the Status from Free to Booked;
```

```
    Update the DB;
```

```
}
```

ID	Status
10	FREE

Will this solution works for Distributed System?

2. Using Distributed Concurrency Control

Optimistic Concurrency Control (OCC)

Pessimistic Concurrency Control (PCC)

But before we learning this, we **MUST** know below **IMPORTANT** things first.

1. What is the usage of **Transaction**?
- 2. What is **DB Locking**?
3. What are the **Isolation Level** present?

1. What is the usage of Transaction?

Transaction helps to achieve **INTEGRITY**. Means it help us to avoid **INCONSISTENCY** in our database.

For example:

Debit the Money from A and Credit the money to B

BEGIN_TRANSACTION:

- Debit the Money from A
- Credit the Money to B

If all success:

 COMMIT;

else:

 ROLLBACK;

END_TRANSACTION;

2. What is DB Locking?

DB Locking, help us to make sure that no other transaction update the locked rows.

Lock Type	Another Shared Lock	Another Exclusive Lock
Have Shared Lock	Yes	NO
Have Exclusive Lock	NO	NO

3. What are the Isolation Level present?

Isolation Level	Dirty Read Possible	Non-Repeatable Read Possible	Phantom Read Possible
Read Uncommitted	Yes	Yes	Yes
Read Committed	No	Yes	Yes
Repeatable Read	No	No	Yes
Serializable	No	No	No

↑
Consistency High

Consistency Low

Dirty Read :

If Transaction A is reading the data which is writing by Transaction B and not yet even committed.
If Transaction B does the rollback, then whatever data read by Transaction A is know dirty read.

	Transaction A	Transaction B	DB
T1	BEGIN_TRASACTION	BEGIN_TRASACTION	ID: 1 Status: Free
T2	Update Row ID:1, Status: Booked		ID: 1 Status: Booked (Not Committed by Transaction B Yet)
T3		Read Row ID:1 (Got status as Booked)	ID: 1 Status: Booked (Not Committed by Transaction B Yet)
T4	Some Issue faced here	Some Computation	ID: 1 Status: Booked (Not Committed by Transaction B Yet)
T5	Rollback	Commit	ID: 1 Status: Free

Non-Repeatable Read :

If suppose **Transaction A**, reads the same row several times and there is a chance that it reads different value.

	Transaction A	DB	
T1	BEGIN_TRANSACTION	ID: 1 Status: Free	
T2	Read Row ID:1 (reads status: Free)	ID: 1 Status: Free	
T3		ID: 1 Status: Booked	← Some other Transaction changed and committed the changes.
T4	Read Row ID:1 (reads status: Booked)	ID: 1 Status: Booked	
T5	COMMIT		

Phantom Read :

If suppose **Transaction A**, executes same query several times and there is a chance that the rows returned are different.

Transaction A		DB
T1	BEGIN_TRANSACTION	ID: 1, Status: Free ID: 3, Status: Booked
T2	Read Row where ID>0 and ID<5 (reads 2 rows ID:1 and ID:3)	ID: 1, Status: Free ID: 3, Status: Booked
T3		ID: 1, Status: Free ID:2, Status: Free ID: 3, Status: Booked
T4	Read Row where ID>0 and ID<5 (reads 3 rows ID:1, ID:2 and ID:3)	ID: 1, Status: Free ID:2, Status: Free ID: 3, Status: Booked
T5	COMMIT	

← Some other Transaction Inserted the row with ID:2 and Committed

Lets come back to the Table Again:

Isolation Level	Dirty Read Possible	Non-Repeatable Read Possible	Phantom Read Possible
Read Uncommitted	Yes	Yes	Yes
Read Committed	No	Yes	Yes
Repeatable Read	No	No	Yes
Serializable	No	No	No

↑ **Consistency High**

Consistency Low

ISOLATION LEVEL	Locking Strategy
Read Uncommitted	Read : No Lock acquired Write: No Lock acquired
Read Committed	Read: Shared Lock acquired and Released as soon as Read is done Write: Exclusive Lock acquired and keep till the end of the transaction
Repeatable Read	Read: Shared Lock acquired and Released only at the end of the Transaction Write: Exclusive Lock acquired and Released only at the end of the Transaction
Serializable	Same as Repeatable Read Locking Strategy + apply Range Lock and lock is release only at the end of the Transaction.

```

SET TRANSACTION ISOLATION LEVEL REPEATABLE READ;

BEGIN_TRANSACTION;

SELECT Query;
Update Query;
If Success:
    COMMIT TRANSACTION;
else:
    ROLLBACK TRANSACTION;

END_TRANSACTION

```

Lets come back to the main Solution of the problem "How to resolve concurrency issue"

Using Distributed Concurrency Control

```
graph TD; A[Using Distributed Concurrency Control] --> B[Optimistic Concurrency Control (OCC)]; A --> C[Pessimistic Concurrency Control (PCC)];
```

Optimistic Concurrency Control (OCC)

- Isolation Level used Below REPEATABLE READ
- Much Higher Concurrency
- No chance of Deadlock
- In case of conflict, overhead of transaction rollback and retry logic is there.

Pessimistic Concurrency Control (PCC)

- Isolation Level used REPEATABLE READ and SERIALIZABLE
- Less Concurrency compared to Optimistic.
- Deadlock is Possible, then transactions stuck in deadlock are forced to do rollback.
- Putting a long lock, sometimes timeout issue comes and rollback need to be done.

Optimistic Concurrency Control (OCC) :

	Transaction A	Transaction B	DB
T1	BEGIN_TRANSACTION	BEGIN_TRANSACTION	ID: 1 Status: Free Version: 1
T2	Read Row ID:1 (Row Version is 1)	Read Row ID:1 (Row Version is 1)	ID: 1 Status: Free Version: 1
T3	Select for Update (Version Validation happens)		ID: 1 Status: Free Version: 1 (Exclusive Lock by Txn A)
T4	Update Row ID:1, Status: Booked, Version:2		ID: 1 Status: Booked Version:2 (Exclusive Lock by Txn A)
T5	COMMIT		ID: 1 Status: Booked Version:2
T6		Select for Update (Version Validation happens)	ID: 1 Status: Booked Version:2 (Exclusive Lock by Txn B)
T7		ROLLBACK	ID: 1 Status: Booked Version:2

T1	T2
Read A	Read B
Write B	Write A

T1	T2
Read A	Read B
Write B	Write A

Commit

A	B
---	---

Report Abuse
